
Challenge 1: Precision Square Path

Program your robot to drive in a **perfect square**, returning as closely as possible to its starting position.

Requirements:

1. Each side of the square should be exactly **30 cm**.
2. Each corner turn should be **90°**.
3. Your final stop should be **within 5 cm** of the original starting point.
4. You may **not** re-position the robot manually.
5. Use a **loop block** to make your code more efficient

Place a marker on the starting point. Can your robot return to it without any adjustments?

Challenge 2: Equilateral Triangle Run

Use **VEXcode IQ's Drivetrain blocks** to drive in a triangle path with **equal-length sides** and **120° angles**.

Requirements:

- Each side should be **40 cm** long.
- Return to the starting point as closely as possible.
- Create your triangle using a **loop** or a **custom block**
